0.1 | Introduction

1 | Phonology and orthography

1.1 | Phoneme inventory

Table 1.1: The consonants of aaaaaaaaaA.

	Bilabial	Alveolar	Palatal	Velar	Glottal
Nasal	m	n	ɲ	ŋ	
Plosive	p b	t d	c ɟ	k ɡ	ʔ
Fricative	f	s	ʃ	x	
(coarticulated)	θ x	ɸ x		ɸʃ	
Affricate		ts	tʃ		
Lateral fricative		ɬ			
Approximant		ɹ	j	w	
Lateral approximant		l			
Trill		r			

Table 1.2: The vowels of aaaaaaaaaA.

Spread	Half-rounded	Rounded
i	ɤ	y
u	ʊ	u
ɛ		œ
ʌ		ɔ
ä		

In addition to consonants and vowels, aaaaaaaaaA has rod signals, represented by numbers. Rod A is blue and held by one's dominant hand and B is red and held by one's non-dominant hand.

1. Rod A is raised to one's chest, while B is pointed down.
2. Rods A and B are crossed in the front.
3. Rod B is raised upwards in front of the nondominant arm, while rod A is lowered.

4. Rod A is pointed sideways near one's nondominant arm, while rod B is lowered.
5. Rods A and B are extended to the sides.
6. Rods A and B are extended, facing forward.
7. Rod A is raised forward, while B is pointed to the side.
8. Rod B is raised forward, while A is pointed to the side.

Lowering both rods is interpreted as an absence of a rod signal.

If the use of rods are unavailable, the numerals of the positions may be pronounced.

1.2 | Hacmisation

aaaaaaaaA uses the hacm script with superscript letters to indicate phonemes not found in Arka. The transcriptions can be found in Tables 1.3 and 1.4.

Table 1.3: The consonants of aaaaaaaaaA.

	Bilabial	Alveolar	Palatal	Velar	Glottal
Nasal	ɒ	n	n ^ɥ	n ^ɣ	
Plosive	d b	f ɳ	f ^ɥ ɳ ^ɥ	ɭ ɸ	.
Fricative	ɑ	ʃ	l	h	
(coarticulated)	j ^h	ɑ ^h		ɑ ^l	
Affricate		ʃʃ	ʎ		
Lateral fricative		s			
Approximant		ɹ	ɥ	o	
Lateral approximant		l			
Trill		ɾ			

Table 1.4: The vowels of aaaaaaaaaA.

Spread	Half-rounded	Rounded
ɕ	ɕ ^ə	ɕ ^ɔ
ə ^ɕ	ə	ə ^ɔ
e		e ^ɔ
ɔ ^e		ɔ
ɪ		

Rod signs are represented by the hacm digits <1 ʃ ʈ ɳ ɥ ɳ Δ> attached to the end of the verbs they encompass. Proper words are preceded by a backslash <\>.

Vowels that are inferrable from context are sometimes omitted. For example, /æ-fan/ (to speak) is written <ɸeɑn>, but /æ-fin/ (to spread), which is less common, is written <ɸeɑcn>, with the second vowel. Most of this grammar will leave all vowels written.

1.3 | Phonotactics

An onset consists of one of the following:

- any single consonant other than /l/ (the exceptions are <le> [lek] and related words),
- any obstruent followed by an approximant other than /l/,
- or any plosive followed by /r/,
- or any nasal followed by /j/ or /w/.

A nucleus consists of one vowel.

A coda consists of one of the following:

- nothing,
- a nasal,
- a voiceless plosive (excluding /ʔ/),
- /ɹ/, /s/ or /l/

1.4 | Stress

Stress falls on the last syllable with a coda, or otherwise the second-to-last syllable.

See table 1.5 for examples.

Table 1.5: Examples of stress locations.

Orthography	Location of stress (# from last)
Dɪʃ	2
nɪ.cn	1
.əʔfələ	2
lɪjnedc ^a	3

1.5 | Vowel harmony

For the purposes of vowel harmony, vowels are divided into front and back vowels.

/a/ is neutral. A root with neither front nor back vowels acts as if it has front vowels.

2 | Syntax

2.1 | Basic word order

The basic word order is VSO. Descriptors follow what they modify.

2.2 | Questions

Binary questions have the interrogative polarity marker and no change to syntax.

In wh-questions, the wh-word is pulled to the front (i. e. before the verb). This requires case marking for the wh-word:

flen peac^əjhi nc^ʔɛ
who-ACC speak-FAR.PAST-Q PR.FAR.SG
Whom did you speak to?

This applies only to questions, not interrogative-mood clauses that act as relative clauses:

peac^əjhi nc^ʔ lel, qif mu.
speak-FAR.PAST-Q PR.FAR.SG who, see-NEAR.PAST PR.ANAPH_OBJ.INT
I saw the person whom you talked to.

2.3 | Multiple clauses

A sentence might have multiple clauses. Each clause in a sentence follows the basic VSO order, and clauses are separated with commas.

3 | Nouns

Nouns are declined for number, case and definiteness.

3.1 | Number

aaaaaaaaA has many grammatical numbers:

Table 3.1: The discrete grammatical numbers of aaaaaaaaaA.

Number	Constraint on $x \in \mathbb{Z}$
Integral	none
Nullary	$x = 0$
Singular	$ x = 1$
Dual	$ x = 2$

Table 3.2: The continuous grammatical numbers of aaaaaaaaaA.

Number	Constraint on $x \in \mathbb{R}$
Nullary	$x = 0$
Subsingular	$ x < 1$
Supersingular	$1 \leq x < 2$
Plural	$ x \geq 2$ or x is unknown

3.2 | Case

In a clause with both the subject and object directly expressed in that order, both the subject and object are declined in the nominative case (and their roles are inferred through word order). In a clause where only one is present, or where both are expressed in the opposite order, the subject will receive the nominative case and the object will receive the accusative case.

3.3 | Noun classes

There are three overarching groups of noun classes.

3.3.1 | Countable

Nouns in these classes are declined for a discrete number.

1. Sentient – such as humans, AIs, deities.
2. Animate – nonsentient animals.
3. Inanimate – anything else.

3.3.2 | Measurable

Nouns in this class are declined for a continuous number.

4. Measure – all measurable nouns, especially units of measurement.

3.3.3 | Uncountable

Nouns in these classes are not declined for number, and require compounding with a countable or measurable noun in order to be quantified.

5. Fluid – liquids and gases.
6. Edible – edible (to humans) non-fluids.
7. Inedible – inedible (to humans) non-fluids.
8. Abstract – abstract ideas.

3.4 | Definiteness

The definite form of a noun is formed regularly by reduplicating the first syllable (without the coda): <𐤃𐤓𐤕> “a person” becomes <𐤃𐤓𐤃𐤓𐤕> “the person”.

3.5 | Declension table

3.5.1 | Countable classes

Note that noun declensions respect vowel harmony. For nouns with back vowels, replace the front vowels with the back vowels of the same height and rounding, and vice versa.

Table 3.3: Declensions for countable nouns.

	Integral	Nullary	Singular	Dual
--	----------	---------	----------	------

	Integral	Nullary	Singular	Dual
Sentient: <ɖɪɪ> “person”				
Nominative	ɖɪɪ	ɖɪɪle	ɖɪɪ	ɖɪɪl
Accusative	ɖɪɪn	ɖɪɪnʰle	ɖɪɪncɟ	ɖɪɪnɪl
Sentient: <ɟʰi.en> “magician”				
Nominative	ɟʰi.en	ɟʰi.eʃe	ɟʰi.eɟ	ɟʰi.el
Accusative	ɟʰi.eɲcn	ɟʰi.enʰle	ɟʰi.eɲcɟ	ɟʰi.eɲcl
(Note that the final consonant is preserved only in the integral nominative form.)				
Animate: <ɖənʰɔ> “rabbit”				
Nominative	ɖənʰɔ	ɖənʰɔɔʰe	ɖənʰɔɟ	ɖənʰɔ.əʰc
Accusative	ɖənʰɔn	ɖənʰɔnʰe	ɖənʰɔn	ɖənʰɔnəʰc
Animate: <ɟcʰɪ> “fox”				
Nominative	ɟcʰɪ	ɟcʰe	ɟcʰɟ	ɟcʰ.c
Accusative	ɟcʰɲcn	ɟcʰnʰle	ɟcʰɲcɟ	ɟcʰɲc
Inanimate: <ɰɪɾəʰ> “statue”				
Nominative	ɰɪɾəʰ	ɰɪɾəʰɔʰe	ɰɪɾəʰɪ	ɰɪɾəʰɟ
Accusative	ɰɪɾəʰɔ	ɰɪɾəʰɔɔʰe	ɰɪɾəʰɔɔʰe	ɰɪɾəʰəʰc
Inanimate: <.cɖen> “house”				
Nominative	.cɖen	.cɖeʃe	.cɖel	.cɖeɟ
Accusative	.cɖeɲcɔ	.cɖeɲcɔɔʰe	.cɖeɲcɔɔʰe	.cɖeɲcac

3.5.2 | Measurable classes

Table 3.4: Declensions for measurable nouns.

	Plural	Nullary	Subingular	Supersingular
Measure: <ɲəɖəʰ> “day (continuous)”				
Nominative	ɲəɖəʰ	ɲəɖəʰɲəʰ	ɲəɖəʰɪ	ɲəɖəʰn
Accusative	ɲəɖəʰn	ɲəɖəʰɲəʰn	ɲəɖəʰnʰe	ɲəɖəʰnəʰn
Measure: <ɖel> “volume” (in expressions such as <ɖel-ɲəɟɔʰ> “cupful”)				
Nominative	ɖel	ɖeɲcʰ	ɖeɲcɪ	ɖeɲcn
Accusative	ɖeɲcn	ɖeɲcʰn	ɖeɲcnʰe	ɖeɲcnɲcn
(Note that the final consonant is preserved only in the plural nominative form.)				

3.5.3 | Uncountable classes

Notably, uncountable-class noun declensions do not respect vowel harmony.

Table 3.5: Declensions for measurable nouns.

	Mass
Fluid: <ɑʰəɲəʰ> “water”	
Nominative	ɑʰəɲəʰ
Accusative	ɑʰəɲəʰn
Fluid: <neled> “nitrogen”	

	Mass
Nominative	ṇeḷeḍ
Accusative	ṇeḷeḍcn
(Here, the coda is preserved in the accusative as well.)	
Edible: <ḷeṃ.cʰ> “beef”	
Nominative	ḷeṃ.cʰ
Accusative	ḷeṃ.cʰn
Edible: <ḍin> “rice”	
Nominative	ḍin
Accusative	ḍincn
Inedible: <ṃəʰʃa> “gold”	
Nominative	ṃəʰʃa
Accusative	ṃəʰʃabe
Inedible: <ḷinɪ> “stone”	
Nominative	ḷinɪ
Accusative	ḷinɪjde
Abstract: <əʰəʰḍa> “empathy”	
Nominative	əʰəʰḍa
Accusative	əʰəʰḍaṇʰ
Abstract: <ḥca> “[the number] five”	
Nominative	ḥca
Accusative	ḥcjcṇʰ

3.6 | Pronouns

Personal pronouns are not divided into first, second and third persons as in most languages. Instead, they fall into four categories which exhibit different behaviour depending on whether they occur as the first or second noun in the clause:

Table 3.6: Pronoun persons and their functions.

Person	Role in first position	Role in second position
Near	The speaker.	The first argument of the sentence. If the first argument is the speaker, then the listener. Otherwise, the speaker. An entity that is neither the speaker, the listener nor the first argument.
Far	The listener.	
Other	A third entity.	
Generic	A generic entity (akin to “one”).	
Anaphoric Subject	The subject of the previous clause.	
Anaphoric Object	The object of the previous clause.	

In wh-questions, the wh-word assumes the second position and the other argu-

ment becomes the first.

If a clause has no explicit arguments, the first argument is understood to be the subject.

Table 3.7: Personal pronouns. <-n>, <-en> or <-ɔ̃n> is suffixed for the accusative case.

(continuous) (discrete)	Pl. / Sub. / Sup. Integral	Nullary Nullary	Singular	Dual
Near	li	leli	de	acɥc
Far	ɔ̃	ɔ̃de	nə̃	bɥi
Other	nc	lenc	sc̃	liɥc
Anaph. Sub.	ɥi	leɥi	.cɔ̃	nʰcɥc
Anaph. Obj.	ɥɔ̃	ɔ̃ɥɔ̃	.ə̃c̃	nʰə̃c̃ɥɔ̃
Generic	.ə̃			

(For the observant readers: notice the similarity to Kavinan’s system.)

3.6.1 | Last-clause pronouns

The anaphoric pronoun <bej> (accusative: <bejen>) is grammatically an other pronoun, and it refers to the previous clause said. Likewise, <bedcj> (accusative: <bedcn>) refers to the clause before the previous one.

3.7 | Compounding

Nouns can be compounded together in a head-initial manner. When that happens, only the leftmost noun is the one to be declined.

ɔ̃l-ɥɔ̃-ə̃-ɥɔ̃-ɥcɥ
volume-cup-water-five
five cupfuls of water

Note that integral pronouns can modify other nouns, in which personal possession is indicated:

ɔ̃l-ɥɔ̃-ə̃-ɥɔ̃-ɥcɥ-li
volume-cup-water-five-PR.NEAR.INTEGRAL
(arg1)’s five cupfuls of water

Descriptors can also compound on nouns. This compounding is productive in aaaaaaaaA.

ɔ̃ɥi-ə̃li
person-old
old people
(Compare to ɔ̃ɥi ə̃li “person old-SENTIENT”.)

3.8 | Possession

“X’s Y” is translated as <Y=D_I jcl X>. The possessive construction is also used to create appositives.

Observe that possession marks the head, and <–D_I> is a clitic, not an affix, as in the following example:

ɒəɒəŋ^oɔj–a^ləpə^o–D_I jcl j^hi.ej
 DEF~rabbit-SING-water=GEN POS magician-SING
 the magician’s water rabbit

In more casual speech, <jcl> may be dropped.

4 | Verbs

Verbs are conjugated for person of the subject, tense, polarity and tellicity, in two paradigms. Conjugation respects vowel harmony.

Table 4.1: Person-tense conjugations for verbs, using <ḍilɪn> “(S) eats (O)”.

	Nonpast	Past
Near	ḍilɪn	ḍilɪf
Far	ḍilɪn	ḍilc ^a ɟ
Other	ḍilɪ	ḍilc ^a
Anaph. Sub.	ḍile	ḍilel
Anaph. Obj.	ḍilc.e	ḍilc.el
Generic	ḍilc ^ɔ	ḍilc ^ɔ

Table 4.2: Person-tense conjugations for verbs, using <peacn> “(S) spreads (O)”.

	Nonpast	Past
Near	peacn	peacɪ
Far	peaɪn	peac ^a ɟ
Other	peaɪ	peac ^a
Anaph. Sub.	peae	peael
Anaph. Obj.	peac.e	peac.el
Generic	peac ^a	peac ^a

to which a suffix is added:

Table 4.3: Polarity-tellicity suffixes for verbs. The interrogative affix can also follow a negative affix.

	Positive	Negative	Interrogative
Telic	–	–le / –ɔ ^e	–hɪ
Atelic	–ɔC / –ɔ ^e C	–ɟɪ	–lc ^a / –lɔ

Notes:

- “Negative atelic” means something akin to “unsuccessfully tried to avoid doing X”.
- The interrogative polarity, in addition to marking questions, is used to mark clauses that may or may not be true but are referred to later in the sentence.

Some examples:

ḏḏḏḏ ḏḏḏḏ ḏḏḏḏ.
eat-NEAR.NONPAST fish flower
Fish eat flowers.

ḏḏḏḏ ḏḏḏḏ ḏḏḏḏ, ḏḏḏḏ ḏḏḏḏ ḏḏḏḏ.
eat-NEAR.NONPAST fish flower, eat-NEAR.NONPAST cat PR.ANAPH_SUB
Fish eat flowers, and cats eat fish.

ḏḏḏḏ ḏḏḏḏ ḏḏḏḏ, ḏḏḏḏ ḏḏḏḏḏḏ.
eat-NEAR.NONPAST fish flower, eat-ANAPH_SUB.NONPAST grass-ACC
Fish eat flowers, and they eat grass.
(Grass is inedible to humans, but edible to fish.)

ḏḏḏḏḏḏ ḏḏḏḏ ḏḏḏḏ.
eat-NEAR.NONPAST-NEG flower fish
Flowers don’t eat fish.

ḏḏḏḏ ḏḏḏḏ ḏḏḏḏḏḏḏ, ḏḏḏḏ ḏḏḏḏ.
carry-OTHER.NONPAST PR.OTHER.SG DEF~book-SG, worry-NEAR.NONPAST PR.NEAR.INT
PR.LAST_CLAUSE
He has the book; that worries me.
or: That he has the book worries me.

ḏḏḏḏḏ ḏḏḏḏ ḏḏḏḏḏḏḏ, ḏḏḏḏ ḏḏḏḏ.
carry-OTHER.NONPAST-INTERROGATIVE PR.OTHER.SG DEF~book-SG, worry-NEAR.NONPAST
PR.NEAR.INT PR.LAST_CLAUSE
He might have the book; that worries me.
or: That he might have the book worries me.

4.1 | Aspect

Verbs can also be marked for aspect, either using a rod sign directly on the verb, or a particle with a rod sign, placed anywhere between the verb it modifies and the next verb.

Table 4.4: Aspect markers. Those with hyphens are attached to verb. Those without hyphens are placed as separate particles anywhere after the verb.

Aspect name	Marking	Meaning
Imperfect	–ɿ	An action that is currently going on. Also used to distinguish static actions as opposed to dynamic (e. g. <i>wear</i> as opposed to <i>put on</i>).
Interrupted	ɿɿɿ	An action that was interrupted.
Perfect	–ɿ	An action that has already finished. Changes present tense to immediate past. Also used to distinguish dynamic actions as opposed to static (e. g. <i>put on</i> as opposed to <i>wear</i>).
Gnomic	–ɿ	A general truth or aphorism, or an action done habitually.
Gnomic dubitative	ɿɿɿ	A general truth or aphorism that the speaker considers to be false.
Deontic necessity	–ɿ	An action that the speaker insists on happening.
Epistemic necessity	ɿɿɿɿ	An action that the speaker infers that is happening.
Deontic potential	–ɿ	An action that the speaker permits to occur.
Epistemic potential	ɿɿɿɿ	An action that the speaker infers that might happen.
Unexpected	–ɿ	An action that is unexpected (akin to using “but”).
Nonexclusive subject	ɿɿ	Indicates that the subject comprises not only of what is explicitly mentioned, but also other things.
Nonexclusive object	ɿɿ	Indicates that the object comprises not only of what is explicitly mentioned, but also other things.
Nonexclusive argument	ɿɿ	Combination of both nonexclusive subject and nonexclusive object.

An example:

ɿɿɿɿɿɿɿɿ de nc, ɿnc.ɿɿɿ dənʰɿdɔ̃⁵–ɿ.
 fight-NEAR.PAST-ATELIC-IMPERFECT PR.NEAR.SG PR.OTHER.INT, shoot-ANAPH_OBJ.PAST-
 UNEXPECTED knee-SG.ACC-PR.ANAPH_SUB.INT
 I tried to fight them, but they shot my knee.

4.2 | Obliques

aaaaaaaaA lacks oblique arguments. Instead, equivalent expressions employ serial verb constructions. For instance, “he ate soup with a spoon” would be reduced to “he held a spoon and ate soup”:

dɿc^a sc^o aɔ^oɿɔ^ol, ɒilɛl sɪdʒɒn.
 INST-OTHER.PAST PR.OTHER.SG spoon-SG, eat-ANAPH_SUB.PAST soup-ACC
 He held a spoon and ate soup.
 or: He ate soup with a spoon.

Likewise:

nɪ.ɪ nc jəjəl-hɪ.ɪp, ncɒɛ hɪhɪɾə^odɔ^o.
 TEMPORAL-OTHER PR.OTHER.INT DEF~day-SG-spring, dance-ANAPH_SUB DEF~statue-SG-ACC
 They will wait until the spring equinox and dance around the statue.
 or: They will dance around the statue on the spring equinox.

A similar construction can be used for the negation of obliques:

dɿc^ale sc^o aɔ^oɿɔ^ol, ɒilɛl sɪdʒɒn.
 INST-OTHER.PAST-NEG PR.OTHER.SG spoon-SG, eat-ANAPH_SUB.PAST-UNEXPECTED soup-ACC
 He did not hold a spoon, but ate soup.
 or: He ate soup without a spoon.

4.3 | Conjunctions

Conjunctions such as “and” are treated like obliques. For instance, “and” is represented by the verb <acn>, and precedes the clause in which the two are used:

ac^a \ɿc^aje \ɿpəl, ɒilɛl fɛp.c^on.
 and-OTHER.PAST Ryse Tarul, eat-ANAPH_SUB.PAST beef-ACC
 Ryse and Tarul ate beef.

Sufficiently complex nesting may be unrepresentable using only anaphoric referents. The easiest way to resolve this issue is to use definite nouns in place of anaphoric referents.

ac^a \ɿc^aje \ɿpəl, ac^a fɛp.c^o sɪdʒɒ, ɒɪlc^a ɒɪɒɪɪl ɱɪ.
 and-OTHER.PAST Ryuse Tarul, and-OTHER.PAST beef soup, eat-OTHER.PAST DEF~person-DU PR.ANAPH_SUB.CONT
 [They,] Ryse and Tarul ate beef and soup.

4.4 | Subordinate clauses

Ideas such as “if” or “because” are also expressed with verbs. For example, <ni.cn> “wait, when” is also used for “if”:

feɸilehi, ni.cn fi bej, aehcn.
 rain-OTHER-NEG-Q, wait-NEAR PR.NEAR.INT ANAPH_CLAUSE, play-NEAR
 If it doesn't rain, we will play.

Note the clausal argument to <ni.cn>, since our condition is an entire clause instead of a noun.

4.5 | Ditransitive-like constructions

In English, some verbs such as *give* take two objects: the item being given and the recipient of the item. Since clauses in aaaaaaaaA can take only one object, translating such verbs requires multiple clauses:

fiɸif de hɸchɸcæn, nebel ɸc^əjen.
 lose-NEAR.PAST PR.NEAR.SG DEF~book, give_to-ANAPH_SUB.PAST Ri^use-ACC
 I gave the book to Ryse.

4.6 | Transitivity

Verbs that are intransitively (i. e. have no object passed at this time) can be turned into a causative form with the prefix <ɸc->:

ɸcɸɸɸɸ aɸeapen^ue.
 fall-NEAR.PAST DEF~coin
 The coins fell.

de ɸcɸcɸɸ^ə aɸeapen^ue
 PR.NEAR.SG TRANS-fall-OTHER.PAST DEF~coin
 I dropped the coins.

Note that the word order changes to SVO. In addition, the verb is conjugated for its object, rather than the subject as expected. If the following clause uses an anaphoric subject, it refers to the object of the current clause.

Moreover, the verb does not need to be one that can never take an object. In the above example, <ɸcɸɸɸɸ> means “(S) falls on (O)”. However, if the verb in question is taking an object, it cannot be transitivised directly and a more roundabout way is required:

ɸcɸɸɸɸ aɸeapen^ue ɸifi.
 fall-NEAR.PAST DEF~coin grass

The coins fell on the grass.

De ꝥcꝥcꝥc^a aꝥeꝥeꝥe^e, ꝥcꝥeꝥ ꝥꝥꝥbe.

PR.NEAR.SG TRANS-fall-OTHER.PAST DEF~coin, fall-ANAPH_SUB.PAST grass-ACC

I dropped the coins; they fell on grass.

or: I dropped the coins on grass.

4.7 | Clauses with nullary arguments

A clause with one or more arguments that are nullary or modified by nullary-number nouns (either through compounding or possession) will have a negative verb as well:

Dəꝥꝥꝥe Dꝥꝥe.

recall-NEAR-NEG person-NULL

No one knows.

ꝥꝥꝥꝥꝥe De ꝥꝥꝥꝥꝥ ꝥꝥ ꝥꝥꝥe.

want-NEAR-NEG PR.NEAR.SG ring=GEN POS magician-NULL

I don't want the rings of any magician.

4.8 | The copula

The copula <jcn> can take a noun as an object, in which case it can mean identity or membership. (Location is expressed with <ꝥꝥ> “be at”.) With no object at all, it is used to denote existence.

It can also accept a descriptor, in which case the descriptor is attached before <jcn> in the dictionary form.

5 | Descriptors

Descriptors act as adjectives or adverbs. They follow what they modify, and are inflected for the noun class or verbal person of their antecedents.

Table 5.1: Descriptor declensions, using the descriptors <hedfi> “large” and <leʔfi> “old”.

Class or person	Declined form	
Sentient	hedfi	leʔfi
Animate	hedfi	leʔfi
Inanimate	hedfe	leʔfə ^e
Measure	hedfiy	leʔfiy
Fluid	hedfej	leʔfə ^e j
Edible	hedfc	leʔfə ^c
Inedible	hedfeʔ	leʔfə
Abstract	hedfc ^a	leʔfə
Near	hedfiy	leʔfiy
Far	hedfiy	leʔfiy
Other	hedfey	leʔfey
Anaph. Sub.	hedfiy	leʔfiy
Anaph. Obj.	hedfey	leʔfey
Generic	hedfc ^y	leʔfə ^y

5.1 | Conversion

A noun can be converted to a descriptor by appending <-i>.

A descriptor can be converted to an abstract noun meaning “the nature of being ~” by replacing the final <-i> with <-cnel>.

6 | Tree mode

As mentioned in section 4.3, anaphoric referents in a linked-list sentence are sometimes insufficient for expressing even simple sentence structures. While the easiest method of resolving this issue is using definite nouns, aaaaaaaaaA also provides a mode where sentences are not linked lists of clauses, but rather (binary) trees.

6.1 | Activation

Tree mode is enabled automatically when the treeing particle <nʏɹ> is used, and disabled at the end of a sentence.

6.2 | Branch-switching

The aforementioned particle <nʏɹ> marks the beginning of the right branch of the tree. The right branch is ended by the particle <nʏɹΔ>, which causes the next clause to join the left and right branches.

(N. B. <nʏɹ> and <nʏɹΔ> can occur only between clauses. If the particles are represented by left and right brackets, respectively, then the brackets should match.)

6.3 | Anaphoric pronouns in joiner clauses

In clauses that join two branches, anaphoric pronouns require marking whether the antecedent occurs in the left predecessor <nʏɹ> or the right predecessor <nʏɹΔ>. This is done by marking the pronoun with <-ɹ> or <-Δ>.

Likewise, verbs can be modified with <-ɹ> or <-Δ> to indicate which branch the subject came from.

6.4 | Errors

The following are ungrammatical:

- Using the particle <nʏɹΔ> or the branched anaphoric pronouns when tree mode is disabled

- Using the particle $\langle n^4\Delta \rangle$ other than to close a corresponding $\langle n^4\eta \rangle$
- Using the unbranched anaphoric pronouns in clauses with two predecessors
- Using the branched anaphoric pronouns in clauses with one predecessor
- Starting a new branch with $\langle n^4\eta \rangle$ when the current branch is empty

6.5 | Example

The second example in section 4.3 can be expressed as follows:

$ac^a \setminus pc^a\eta \setminus \eta\mu\theta$, $n^4\eta \ ac^a \ \eta\mu.c^\circ \ sidjc$, $n^4\Delta \ \eta\eta\eta\eta \ \mu cn\Delta$.

The resulting tree is shown below:

7 | Numerals

aaaaaaaaA uses a mixed-base system for its numerals. Numerals are abstract nouns.

7.1 | Single-digit numerals

Here are the numerals for $n < 17$:

Table 7.1: The cardinal numbers from 0 – 16.

base 10	base v	word
0	0	μəɒ
1	1	ac ^ə l
2	2	ʃɪj
3	3	ɔ ⁴ e ^ɔ n
4	4	ɑ ⁴ ɪμ
5	5	ʔcɟ
6	6	ɒɥe
7	7	ʃɟɟ
8	Δ	də ^ɔ n
9	L	hed
10	F	bən ^ɸ
11	7	nə ^c
12	£	le ^ɔ
13	‡	j ^h cd
14	A	ɥɪn
15	V	ɫel
16	ψ	.ɪμ

Note that digits above 9 use capital hacm letters.

7.2 | Numerals up to $19 \cdot 17$

These are represented by two digits. The multiples of 17 are shown below:

Table 7.2: Multiples of 17, up to $18 \cdot 17$.

base 10	base v	word
17	10	selc ^a
34	J0	ɔɪlc ^a
51	ʔ0	ɔ ⁴ e ³ lc ^a
68	00	ʃɪlc ^a
85	ʔ0	ɸcʃlc ^a
102	ʃ0	ɔ ⁴ elc ^a
119	90	ʃcʃlc ^a
136	Δ0	də ³ nə
153	L0	helc ^a
170	F0	bən ^ʋ ə
187	70	nə ^c lə
204	£0	le ³ lc ^a
221	‡0	j ^h cdlc ^a
238	A0	ɥinc ^a
255	∇0	ɫelɥc ^a
272	ψ0	.ɪɥc ^a
289	Ð0	jɪlsc ^a
306	℥0	heɔdc ^a

Thus $y \cdot 17 + x$ is written $\langle x-y \rangle$.

7.3 | Numerals up to $13 \cdot 19 \cdot 17 = 4199$

These are represented by three digits. The multiples of $19 \cdot 17$ are listed below:

Table 7.3: Multiples of $19 \cdot 17$, up to $12 \cdot 19 \cdot 17$.

base 10	base v	word
323	100	hɪjɪn
646	J00	ʃɪjɪn
969	ʔ00	ɔ ⁴ e ³ jeɪn
1292	000	α ¹ ɪɪn
1615	ʔ00	ɸcɪjɪn
1938	ʃ00	ɔ ⁴ eɪjɪn
2261	900	ʃcɪjɪn
2584	Δ00	də ³ nɪn
2907	L00	heɪn
3230	F00	bən ^ʋ ɪn
3553	700	nə ^c ɪn
3876	£00	le ³ ɪn

Thus $(z \cdot 19 \cdot 17) + (y \cdot 17) + x$ is written $\langle z-x-y \rangle$.

7.4 | Numerals up to and including $4199 \cdot (4199 + 1)/2 = 8817900$

The numeral for 4199 is $\langle \text{ḡḡ.ḡḡḡ} \rangle$, written as $\langle 1:000 \rangle$.

Likewise, two $\langle \text{ḡḡ.ḡḡḡ} \rangle$ is written as $\langle 1:000 \rangle$ and pronounced $\langle \text{ḡḡ.ḡḡḡ} - \text{fij} \rangle$, but the second $\langle \text{ḡḡ.ḡḡḡ} \rangle$ is one smaller than the first. In other words, $\langle 1:000 \rangle = 4199 + (4199 - 1) = 8397$.

Table 7.4: “Multiples” of $\langle \text{ḡḡ.ḡḡḡ} \rangle$.

“Multiple”	Difference from last	Total
(0)		0
1:000	4199	4199
1:000	4198	8397
ḡ:000	4197	12594
ḡḡ:000	4196	16790
ḡḡḡ:000	4195	20985
...		
ḡḡḡḡ:000	3	8817897
ḡḡḡḡḡ:000	2	8817899
1::000:000	1	8817900

Thus the n th “multiple” differs from the $(n-1)$ th multiple by $(4199 + 1 - n)$ (given $1 \leq n \leq 4199$), and the sum of the first n “multiples” is

$$\sum_{i=1}^n (4200 - i) = \frac{1}{2} \cdot (8399 \cdot n - n^2)$$

And likewise, for some given y , the largest “multiple” of $\langle \text{ḡḡ.ḡḡḡ} \rangle$ not smaller than y has the index

$$n = \left\lfloor \frac{1}{2} \cdot (8399 - \sqrt{70543201 - 8 \cdot y}) \right\rfloor$$

In other words, for any numeral $\langle x:y \rangle$, $x + y$ must be less than 4199.

7.5 | Cardinal and ordinal numerals

Cardinal numerals compound to their antecedents; ordinal numerals use the possessive $\langle -\text{ḡḡ} \text{ jcl} \rangle$ construction:

$\text{ḡḡḡḡ} - \text{ḡḡḡḡḡ}$
 child-three
 three children

$\text{ḡḡḡḡḡ} \text{ jcl } \text{ḡḡḡḡḡ}$
 child-SG=GEN POS three
 the third child

8 | Names

Names fall into two grammatical categories:

- *Nominal names* act as nouns. They are usually single words.
- *Clausal names* are entire clauses. These names usually refer to places, although a few people have clausal names. In extreme cases, such a name can span multiple clauses.

8.1 | Nominal names

These names act as nouns, and they are preceded by a backslash <\>. If the name spans multiple words (as common in foreign names), spaces are escaped by backslashes. No distinction is made between native and foreign names.

Only personal names can stand on their own, and even then, only given or full names. Other names must modify a common noun describing the nature of what is named, in the integral number without definiteness.

Table 8.1: Some examples of nominal names.

Name	Type
\pɕ ^ə je	Personal (native)
\ɸɪpəl	Personal (native)
\pɛɓcn	Personal (foreign)
dpe ^ɔ ɓe-\oɪɪ.c	Place (foreign)

Native names will usually respect vowel harmony. Children of parents who work in professions demanding physical labour (e. g. bricklaying) will usually have names with back vowels. In contrast, those born to parents of professions that do not demand physical strength (e. g. computer programming) will usually bear names with front vowels.

These names comprise of one or more clauses. Due to the nature of clausal names, they are all considered native. Most of these names refer to places; personal clausal names are almost always nicknames or such. Orthographically, they are put into square brackets <[]>.

We call the *referent* the subject, the object or the verb of the last clause, respectively depending on the type of anaphoric pronoun used to refer to the name. If the referent is a noun, it must be declined in the integral number without definiteness.

Table 8.2: Some examples of clausal names.

Name	Type	Literal meaning
[AEXʰEʰ dɾɪlɪjɪ ɾɔɔɔ]	Place	The trees covered the ground
[Dəɪ ʰXEʰDE ɱɔɔ]–\lenɱɔɔ]	Place	The city remembers the Šedry star
[aɔɔ ɪɱɪʰə–Dɪ jɔɔ jəɱ jʰɪ.en–Dɪ jɔɔ ɪnɔɔʰ, ʰoejɔɔ.el ʰXEʰDEɔɔ]	Place	The city was founded by the warrior of the sun and the wizard of the moon
[Dejɪ \ʰETɬɬɬ jɔɔɔ–selɔɔ]	Personal	Gulto takes care of 17 foxes

ni.ɪ biːnən-bəj, [bəɫi dpeʔbe ɲəʔ]-\lenɲəʔ, ʝi diːdiɲ .CD.
wait-OTHER year-future, (name), go-OTHER DEF~person-SG PR.ANAPH_SUB.SG
He will go to Muta Pröme Ryk-Šedry̆ next year.

9 | Calendar

Domain II, which contains *Rymako* has a day that is 26.99410 hours long. Other figures are given in terms of local days:

Table 9.1: Astronomical measures for Domain II.

Period	Length in local days
Local (synodic) day	1.00000
Sidereal day	0.99699
Tropical year (l_y)	301.94714
Sidereal year	302.03719
Synodic month (l_m)	30.80152
Sidereal month	27.95032

9.1 | Tides

In Domain II, the offset of the sea level due to the tide can be modeled by the following equations:

$$y = y_s + y_m \quad (9.1)$$

$$y_s = A_s \cdot (1 + A_{sa} \cdot \cos(\tau \cdot t)) \cdot \cos(2 \cdot \tau \cdot t) \quad (9.2)$$

$$y_m = A_m \cdot \left(1 + A_{ma} \cdot \cos\left(\frac{\tau \cdot t}{l_m}\right)\right) \cdot \cos\left(\frac{2 \cdot \tau \cdot (1 - l_m) \cdot t}{l_m}\right) \quad (9.3)$$

where:

$$\begin{aligned}
\tau &= 2 \cdot \pi \\
A_s &\approx 0.675 \\
A_{sa} &\approx 0.0532 \\
A_m &\approx 1.267 \\
A_{ma} &\approx 0.176 \\
y &= \text{offset of sea level in metres} \\
t &= \text{time since HAT in local synodic days}
\end{aligned}$$

An exact solution to $dy/dt = 0$ is not known to exist. However, the solutions to this equation can be found numerically. Consult Section 9.4 for a Sage program to do so.

As the calendar used by aaaaaaaaaA uses the high and low tides to count time, it is not synchronised even with days. The basic unit of time in the calendar is the *tidal day* $\langle \mu\alpha\delta\alpha^c \rangle$ (l_t) – the amount of time between a high tide and the second high tide thereafter, which is, on average, 1.03356 local synodic days, but can vary considerably. Thus:

$$l_m/l_t \approx 29.80148 \quad (9.4)$$

$$\approx 4053/136 \quad (9.5)$$

$$l_y/l_m \approx 9.80299 \quad (9.6)$$

$$\approx 7215/736 \quad (9.7)$$

This suggests that:

1. most months will have 30 days, but every 136 months, 27 months will have only 29.
2. most years will have 10 months, but every 736 years, 145 years will have only 9.

9.2 | Months

Months follow a 136-year cycle wherein the $5n + 2$ -numbered months (zero-indexed, $n \in \mathbb{N}$) have 29 days and the other months have 30.

The names of months, on the other hand, are determined from their positions relative to the first month of the year:

9.3 | Years

The lengths of the year follow a 736-year cycle as specified in 9.1. The code used to generate this table can be found in Section 9.5.
