4 CONTENTS

# 1 | Phonology and orthography

### 1.1 | Phoneme inventory and romanisation

aaaaaaaaaaaaases the following phonemes:

Table 1.1: The consonants of aaaaaaaaaaaaa.

	Linguolabial	Alveolar	Palatal
Plosive	p b /t̯ d̯/	t d /t d/	kg/cJ/
Fricative	f /@/	þ /θ/	
(sibilant)		s /s/	
(lateral)	ḟ /ੈੈ./	s ż /Ҹ ӄ/	
(nareal)		h /n̥ਁ/	
Approximant		r / ɹ/	j /j/
Nasal	m /m̯/		n /ɲ/

Table 1.2: The vowels of aaaaaaaaaaaaaa.

	Front	Central	Back
High	i î /i i:/		u û /u u:/
Mid			o ô /ə o:/
Low		a â /a aː/	

In addition, short vowels other than /i/ can be diphthongised with /i/ = /j/ to form, for instance,  $\langle aj \rangle /ai/$  or  $\langle ja \rangle /ia/$ . However, at the start of a syllable, /j/ is treated as a consonant.

### 1.2 | Phonotactics

Syllables are composed of:

- An onset either:
  - any consonant other than  $\langle m \rangle /n /$

- at the beginning of the word, nothing at all, but any medial syllables with an empty onset will receive an epethentic [4] at that position.
- A rime one of:
  - A long vowel or diphthong, and nothing else (diphthongs with onglides are not allowed if the onset is  $\langle j \rangle / j / j$
  - A short vowel followed by one of  $\langle p m r \rangle / \theta n a / \theta$

Double instances of a consonant between syllables are resolved as such:

- $/\theta.\theta/ \rightarrow [\theta.t]$
- $/\theta.\theta t/ \rightarrow [\theta.t']$
- /ҳ.ҳ/ → [ҳ.¹]

These are not respelt.

### 1.3 | Allophony

The following rules are applied:

$$\begin{cases} \{u,u:\} \rightarrow \{y,u:\} & (C_1\{+ll\} \spadesuit) \\ \{\mathfrak{d},\mathfrak{o}:\} \rightarrow \{\mathfrak{d},\mathfrak{o}\underline{u}\} & (C_1\{+ll\} \spadesuit) \\ \\ \mathfrak{d} \rightarrow \mathring{\underline{\mathfrak{d}}} & ( \spadesuit C_1[+ll]) \\ \{t,d\} \rightarrow \{\underline{t},\underline{d}\} & (\underline{n} \spadesuit) \\ \\ \underline{n} \rightarrow n & ( \spadesuit C_1[+av]) \\ \\ \underline{\theta} \rightarrow \underline{\theta} \check{\mathfrak{d}} & ( \spadesuit C_1[+ll]) \\ \\ \underline{\theta} \rightarrow \underline{\theta} \check{\mathfrak{d}} & ( \spadesuit \{a,a:,\mathfrak{d},\mathfrak{o}:\}) & \left[ \operatorname{frac} \left( \sqrt{\#\sigma + \#C} \right) < 0.5 \right] \\ \\ \underline{\theta} \rightarrow \check{\mathfrak{d}} & ( \spadesuit C_1[+v]) \\ \\ C_1[-v] \rightarrow C_1[+a] & ( \spadesuit V_1[+s]) \\ \end{cases}$$

#### 1.4 Stress

Much like Drahýl Rase, aaaaaaaaaaaa has the concept of natural stress. That is, if syllables with short vowels are considered short and those with long vowels or diphthongs are long, then:

- if the penultimate syllable is long, then it is stressed
- if the antepenultimate syllable is long, then it is stressed
- if the ultimate syllable is long, then it is stressed
- otherwise, the penultimate syllable is stressed

However, aaaaaaaaaaa is less free with deviations from this pattern. Notably, if the last three syllables are short, then the antepenultimate syllable can receive the stress instead. In the romanisation, this is marked with an acute accent.

# 2 Syntax

The basic word order of aaaaaaaaaaa is one of  $\{N_1VN_2, N_1N_2V, VN_1N_2, N_1V, VN_2\}$ .  $N_1$  and  $N_2$  are the "subject" and "object" of a verb, in either order.

Adjectives are placed farther from the verb than their antecedents. If an adjective A modifies an N, then the onsets of A and N are switched. Adverbs occur at either the beginning or the end of the clause.

#### 2.1 | Pivots

When two clauses  $\alpha$  and  $\beta$  are joined by a clausal conjunction, some arguments may be omitted in the second clause.

- If  $\beta.N_1$  is omitted, then it defaults to  $\alpha.N_2$  (inner pivot).
- If  $\beta . N_2$  is omitted, then it defaults to  $\alpha . N_1$  (outer pivot).
- If  $\beta$ . V is omitted, then it defaults to  $\alpha$ . V (verb pivot).

Noun phrases joined by nominal conjunctions work differently. The rules for those that occur after the verb are listed:

$$N_1^i A_1^i + N_2^j A_2^j \to N_1 A_1 + N_2 A_2$$
 (2.1)

$$N_1^i A_1^j + N_2^j A_2^i \to (N_1 + N_2)(A_1 + A_2)$$
 (2.2)

$$N_1^i A^i + N_2 \to N_1 A + N_2 A$$
 (2.3)

$$N_1 A^i + N_2^i \to (N_1 + N_2) A$$
 (2.4)

$$N^{i}A_{1}^{i} + {}^{j}A_{2}^{j} \to NA_{1} + NA_{2}$$
 (2.5)

$$N^i A_1^j + {}^j A_2^i \to N(A_1 + A_2)$$
 (2.6)

$$N_1 + N_2^i A^i \to N_1 A + N_2 \varnothing \tag{2.7}$$

The sequences are reversed before the verb.

For instance, using  $\langle ki \rangle$  and  $^1$ ,  $\langle napu \rangle$  fish,  $\langle pjiko \rangle$  cat,  $\langle karaha \rangle$  fast and  $\langle dombu \rangle$  heavy, we have the following (assuming that these NPs follow the verb):

 $<sup>^1</sup>$ There are two meanings that correspond to English's and. The first is a bundle of both arguments present; the second is an object that has the properties of both arguments. Consider *The dog and bird are a mammal and*<sub>1</sub> *bipedal* versus *The human is a mammal and*<sub>2</sub> *bipedal*.  $\langle ki \rangle$  uses the former interpretation for nouns and the latter for adjectives.  $\langle ab \rangle$  uses the latter interpretation for both nouns and adjectives.

8 CHAPTER 2. SYNTAX

- **\( \langle kapu naraha ki djiko pombu \rangle \) the fast fish and the heavy cat**
- \(\dapu \) paraha ki njiko kombu\(\rangle\) the (fast and heavy) (fish and cat)
- **\( \kapu naraha** \ki pjiko \rangle \the fast fish and the fast cat
- \( \text{napu paraha ki kjiko} \) the fast (fish and cat)
- <kapu naraha di kombu> the fast fish and the heavy fish
- <kapu daraha ni kombu> the (fast and heavy) fish
- <napu ki kjiko paraha> the (fast fish) and the cat

# 3 Nouns

#### 3.1 | Conceptualisation

Nouns are declined for the following categories:

- number-emergence
- similitude
- · specificity

#### 3.1.1 | Number-emergence

Number and emergence (cf. *The Avonian Language* 8.13.1 40) describes not only the quantity of an object but also any additional properties borne by the group.

- *Unmarked* is the default form of the noun.
- Reduced is closest to English's plural form and confers no additional properties to a group of objects. Compared with the unmarked N-E, the reduced N-E is used the most often with human nouns, less often with other animates and rarely with inanimate nouns. With uncountable nouns, the unmarked form is always used.
- *Emergent* describes a group of objects with properties extending beyond its components but also individual qualities.
- *Coherent* describes an entity that cannot be meaningfully divided into its individual parts.

#### 3.1.2 | Similitude

Similitude (cf. *The Avonian Language* 8.13.2 41) describes the differences among different objects of a group.

- *Identical* means that a similar group with n elements as the one mentioned fall into  $O(\log \log n)$  identities (to a margin of error) e. g. a pile of candies or an orchard of apple trees.
- Similative means that the members of the group in question are similar in name only e. g. a forest with different species of plants.

10 CHAPTER 3. NOUNS

• Related means that at least one entity is the item in question and the others are related to it – e.g. spoons and other utensils.

#### 3.1.3 | Specificity

This refers to whether a noun phrase is unique in a given context and has two values: specific and nonspecific.

### 3.2 | Application

In aaaaaaaaaaa, the default form of the noun is the unmarked similative specific form.

#### 3.2.1 | The stem and the ending

The ending of a noun is the rime of the last syllable, and the stem everything before that. For instance, the ending of  $\langle napu \rangle$  fish is  $\langle -u \rangle$  and its stem  $\langle nap- \rangle$ .

#### 3.2.2 | Stem alternation

If the noun is not stressed on the last syllable, then the consonant cluster after the stressed vowel is lenited as shown in table 3.1 in the weak form of the stem.

Onset \ Coda	Ø	þ	m	r	Onset \ Coda	Ø	þ	m	r
р	b	f	mb	rb	n	h	þn	n	n
b	b	þ	ḟ	f	sþ	S	þþ	f	rþ
f	f	f	mb	rf	tþ	þ	þþ	mþ	rþ
f	Ė	Ė	mḟ	rḟ	tr	g	þr	mþr	rr
t	d	þ	md	rd	þr	r	þr	mþ	rþ
d	r	þ	md	r	sr	r	þr	md	rr
þ	þ	þ	f	rd	hr	r	þr	mr	rr
S	Ś	þ	f	r	þt	þ	þt	тþ	rþ
Ė	ż	Ś	mż	rż	ht	t	þt	mt	rt
Ż	r	ż	mż	r	rt	rd	þr	md	rd
h	n	þn	n	r	þd	þ	þþ	тþ	rþ
r	r	dr	r	r	rś	rż	þż	mż	rż
k	g	þg	n	rg	rḟ	rḟ	þḟ	mḟ	rb
g	g	þg	n	r	þtr	þr	þtr	mþr	rþr
j	j				htr	tr	þtr	mtr	rtr

Table 3.1: Lenitions of consonant clusters.

For instance, the weak form of the stem for  $\langle napu \rangle$  is  $\langle nab- \rangle$ .
